Docket No.: 42390.P7876X

AMENDMENTS TO THE CLAIMS

Listing of claims:

1. (Original) A method of processing network data in a network processor comprising:

scheduling a first thread to process a first incoming block of data; and scheduling a second thread to process a second incoming block of data prior to the first thread completing.

- 2. (Original) The method of claim 1, wherein the first incoming block of data and the second incoming block of data are from a common data packet.
- 3. (Original) The method of claim 2 further comprising: saving state information by the first thread; and retrieving the state information by the second thread.
- 4. (Original) The method of claim 3, wherein the state information includes a pointer into a memory indicating where to move the first and second incoming blocks of data.
- 5. (Original) The method of claim 4 further comprising: storing data to memory in a sequential ordering based on the state information.
- 6. (Original) The method of claim 5 further comprising: providing the state information to transmit circuitry.
- 7. (Original) A method of processing a data packet received over a network comprising:

processing a first portion of the data packet using a first thread; and

Appl. No.: 09/626,535

Docket No.: 42390,P7876X

simultaneously processing a second portion of the data packet using a second thread.

- 8. (Original) The method of claim 7 wherein the first thread and the second thread do not time share processing with one another.
- 9. (Original) The method of claim 8 wherein the first thread and the second thread operate out of different microengines.
- 10. (Original) The method of claim 7 wherein the first thread and the second thread time share processing with one another.
- 11. (Original) The method of 10 wherein the first thread and the second thread operate out of a common microengine.
- 12. (Original) The method of claim 7 comprising: simultaneously with processing the first portion and the second portion of the data packet, processing a third portion of the data packet using a third thread.
- (Original) The method of claim 12 wherein the first thread, the second thread, 13. and the third thread run the same code.
- 14. (Original) The method of claim 13 wherein the first thread, the second thread, and the third thread do not time share processing with one another.
- 15. (Original) An article comprising a computer-readable medium which store computer-executable instructions for receiving data from a plurality of ports, the instructions causing a computer to:

process a first portion of a data packet using a first thread; and process a second portion of the data packet using a second thread, wherein there is no time sharing between the first thread and the second thread.

Appl. No.: 09/626,535

Docket No.: 42390.P7876X

- (Original) The article of claim 15, the article further comprises instructions to: 16. save state information of the first thread; and restore the state information by the second thread.
- 17. (Original) The article of claim 16, the article further comprises instructions to: provide the state information to transmit circuitry when an end of packet is detected by a subsequent trial.
